

Lecture 11

From verification to synthesis

Nadia Polikarpova

Map of the unit

Constraint-based synthesis

- How to solve constraints about infinitely many inputs? CEGIS
- How to encode semantics of looping / recursive programs?
 - Bounded reasoning
- • Unbounded / deductive reasoning

Enumerative (and deductive) synthesis

- How to use deductive reasoning to guide the search?

Verification

```
method SumMax (a: array<int>) returns (sum: int, max: int)
  requires a != null;
  ensures sum <= a.Length * max;
{
  sum, max := 0, 0;
  var i := 0;
  while (i < a.Length)
    invariant 0 <= i <= a.Length && sum <= i * max;
    decreases a.Length - i;
  {
    if (max < a[i]) { max := a[i]; }
    sum := sum + a[i];
    i := i + 1;
  }
}
```

Dafny

correct!

AutoProof

can't proof
correctness

VCC

Verifast

...

Invariant inference

```
method SumMax (a: array<int>) returns (sum: int, max: int)
  requires a != null;
  ensures sum <= a.Length * max;
{
  sum, max := 0, 0;
  var i := 0;
  while (i < a.Length)
    invariant ??;
    decreases ??;
  {
    if (max < a[i]) { max := a[i]; }
    sum := sum + a[i];
    i := i + 1;
  }
}
```

BLAST
Astrée
FB Infer
LiquidHaskell
...

correct!

invariant $0 \leq i \leq a.Length$
&& $sum \leq i * max$;
decreases $a.Length - i$;

can't find an invariant that
lets me prove correctness

Program synthesis

```
method SumMax (a: array<int>) returns (sum: int, max: int)
  requires a != null;
  ensures sum <= a.Length * max;
{
  var i;
  ??;
  while (??)
    invariant ??;
    decreases ??;
  {
    ??;
  }
}
```

→
VS3
Natural Synthesis
(Leon)
(Synquid)

found a correct program!

```
sum, max := 0, 0;
var i := 0;
while (i < a.Length)
  invariant 0 <= i <= a.Length && sum <= i * max;
  decreases a.Length - i;
{
  if (max < a[i]) { max := a[i]; }
  sum := sum + a[i];
  i := i + 1;
}
```

can't find a (program,
invariant) pair that I can
prove correct

Verification \rightarrow inference \rightarrow synthesis

Verification

Program logic

$$\forall x . Q(x)$$

verification
condition

$$\equiv \exists x . \neg Q(x)$$

SMT

UNSAT

SAT

Inference

Program logic

$$\exists I . \forall x . Q(I, x)$$

unknown formulas for
invariants

Synthesis

Program logic

$$\exists I P . \forall x . Q(I, P, x)$$

unknown formulas for
invariants and commands

on the bright side: not much
harder than inference!

How verification works

Verification

$\forall x . Q(x)$

Step 1: eliminate loops

$\{T\}$

```
sum := 0;
max := 0;
i := 0;
while (i < a.Length)
  invariant i <= a.Length;
  invariant sum <= i * max;
{
  assert i < a.Length;
  if (max < a[i]) { max := a[i]; }
  sum := sum + a[i];
  i := i + 1;
}
```

$\{s \leq a.L * m\}$

$\{T\}$

```
sum := 0;
max := 0;
i := 0;
```

$\{i \leq a.L \wedge s \leq i * m\}$

$\{i \leq a.L \wedge s \leq i * m \wedge i < a.L\}$

```
assert i < a.Length;
if (max < a[i]) { max := a[i]; }
sum := sum + a[i];
i := i + 1;
```

$\{i \leq a.L \wedge s \leq i * m\}$

$\{i \leq a.L \wedge s \leq i * m \wedge \neg(i < a.L)\}$

skip

$\{s \leq a.L * m\}$

Step 2: generate VC

$\{T\}$

\Rightarrow

$\{0 \leq a.L \wedge 0 \leq 0 * 0\}$

sum := 0; max := 0; i := 0

$\{i \leq a.L \wedge s \leq i * m\}$

$T \Rightarrow$
 $0 \leq a.L \wedge 0 \leq 0 * 0$

$\{i \leq a.L \wedge s \leq i * m \wedge \neg(i < a.L)\}$

skip

$\{s \leq a.L * m\}$

$i \leq a.L \wedge$
 $s \leq i * m \wedge \neg(i < a.L) \Rightarrow$
 $s \leq a.L * m$

Step 2: generate VC

$$\{i \leq a.L \wedge s \leq i * m \wedge i < a.L\}$$
$$\Rightarrow$$
$$i + 1 \leq a.L \wedge (m < a[i] \Rightarrow s + a[i] \leq (i + 1) * a[i]) \\ \wedge (\neg(m < a[i]) \Rightarrow s + a[i] \leq (i + 1) * m) \wedge i < a.l$$

```
assert i < a.Length;
```

```
if (max < a[i]) { max := a[i]; }
```

$$i + 1 \leq a.L \wedge s + a[i] \leq (i + 1) * m$$

```
sum := sum + a[i];
```

```
i := i + 1;
```

$$\{i \leq a.L \wedge s \leq i * m\}$$

$$i \leq a.L \wedge s \leq i * m \wedge i < a.L \Rightarrow$$
$$i + 1 \leq a.L \wedge$$
$$(m < a[i] \Rightarrow s + a[i] \leq (i + 1) * a[i]) \wedge \\ (\neg(m < a[i]) \Rightarrow s + a[i] \leq (i + 1) * m) \wedge \\ i < a.l$$

Step 3: Ask the solver

$\forall a \ i \ s \ m .$

$\top \Rightarrow$

$$0 \leq a.L \wedge 0 \leq 0 * 0$$

\wedge

$$i \leq a.L \wedge$$

$$s \leq i * m \wedge \neg(i < a.L) \Rightarrow$$

$$s \leq a.L * m$$

\wedge

$$i \leq a.L \wedge s \leq i * m \wedge i < a.L \Rightarrow$$

$$i + 1 \leq a.L \wedge$$

$$(m < a[i] \Rightarrow s + a[i] \leq (i + 1) * a[i]) \wedge$$

$$(\neg(m < a[i]) \Rightarrow s + a[i] \leq (i + 1) * m) \wedge$$

$$i < a.l$$

SMT

UNSAT

Programs as transition systems

```
{T}
  sum := 0;
  max := 0;
  i := 0;
{i ≤ a.L ∧ s ≤ i * m}
```

```
{T}
  sum' := 0;
  max' := 0;
  i' := 0;
{i' ≤ a.L ∧ s' ≤ i' * m'}
```

$s' = 0$
 $\wedge m' = 0$
 $\wedge i' = 0$

```
{i ≤ a.L ∧ s ≤ i * m ∧ i < a.L}
  assert i < a.Length;
  if (max < a[i]) { max := a[i]; }
  sum := sum + a[i];
  i := i + 1;
{i ≤ a.L ∧ s ≤ i * m}
```

```
{i ≤ a.L ∧ s ≤ i * m ∧ i < a.L}
  assert 0 ≤ i < a.Length;
  if (max < a[i]) { max' := a[i]; }
  sum' := sum + a[i];
  i' := i + 1;
{i' ≤ a.L ∧ s' ≤ i' * m'}
```

$s' = a + a[i]$
 $\wedge m' = m < a[i] ?$
 $\quad a[i] : m$
 $\wedge i' = i + 1$

```
{i ≤ a.L ∧ s ≤ i * m ∧ ¬(i < a.L)}
  skip
{s ≤ a.L * m}
```

```
{i ≤ a.L ∧ s ≤ i * m ∧ ¬(i < a.L)}
  sum' := sum; max' := max
{s' ≤ a.L * m'}
```

$s' = s$
 $\wedge m' = m$
 $\wedge i' = i$

VC for transition systems

$\{T\}$

$$s' = 0 \wedge m' = 0 \wedge i' = 0$$

$\{i' \leq a.L \wedge s' \leq i' * m'\}$

$$T \wedge s' = 0 \wedge m' = 0 \wedge i' = 0 \Rightarrow i' \leq a.L \wedge s' \leq i' * m'$$

$\{i \leq a.L \wedge s \leq i * m \wedge i < a.L\}$

$$s' = a + a[i] \wedge i' = i + 1 \\ \wedge m' = \max(m, a[i])$$

$\{i' \leq a.L \wedge s' \leq i' * m\}$

$$i \leq a.L \wedge s \leq i * m \wedge i < a.L$$

$$\wedge s' = a + a[i] \\ \wedge m' = \max(m, a[i]) \wedge i' = i + 1 \Rightarrow i' \leq a.L \wedge s' \leq i' * m'$$

$\{i \leq a.L \wedge s \leq i * m \wedge \neg(i < a.L)\}$

$$s' = s \wedge m' = m \wedge i' = i$$

$\{s' \leq a.L * m'\}$

$$i \leq a.L \wedge s \leq i * m \wedge \neg(i < a.L) \\ \wedge s' = s \wedge m' = m \wedge i' = i \Rightarrow s' \leq a.L * m'$$

Verification with transition systems

From verification to inference

Verification

$$\forall x . Q(x)$$

$$\equiv \exists x . \neg Q(x)$$

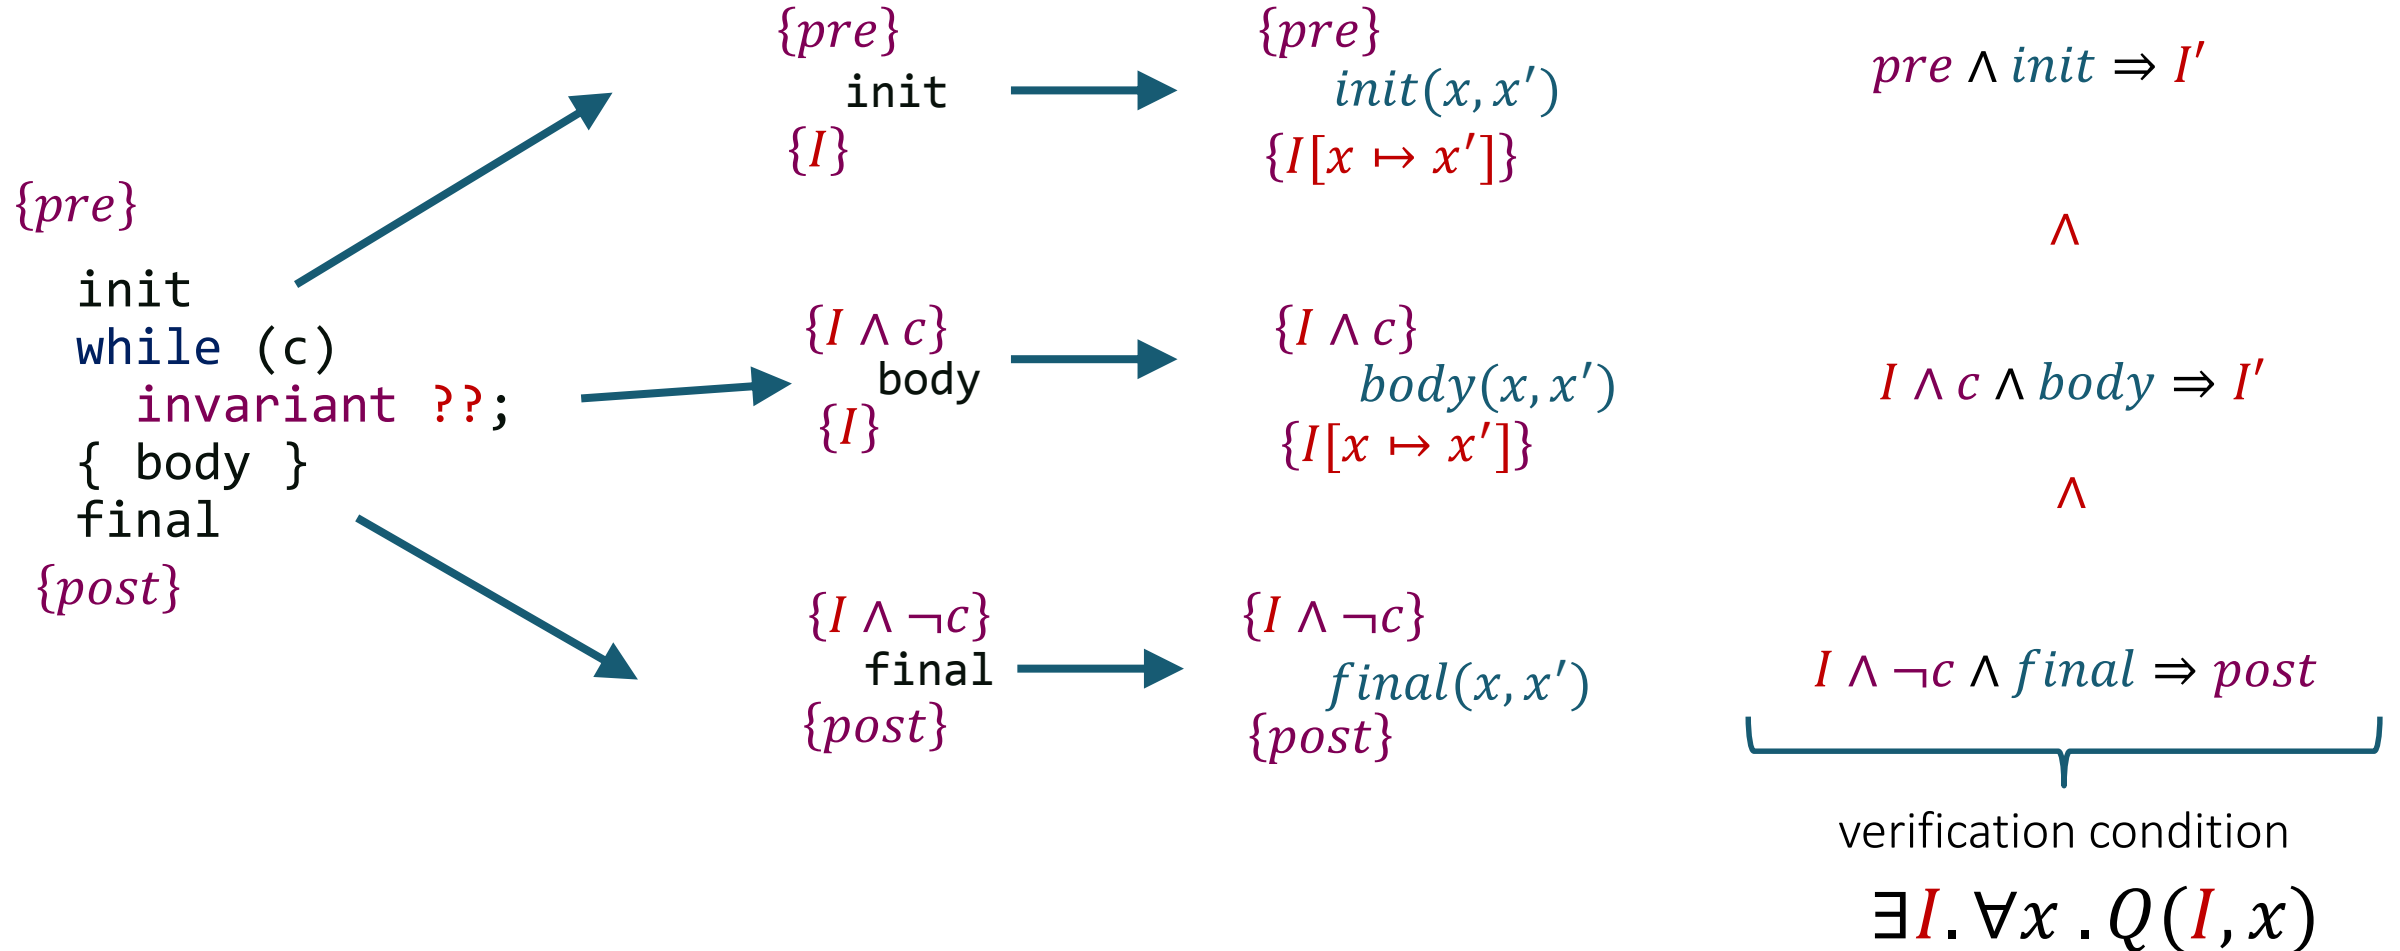

UNSAT / SAT

Inference

$$\exists I . \forall x . Q(I, x)$$

Invariant inference

Horn constraints

Constraints of this form are called Horn constraints (clauses)

$$\phi \Rightarrow I'$$

$$I \wedge \psi \Rightarrow I'$$

$$I \Rightarrow \omega$$

How do we find I ?

- Fix a *domain* (search space)
- Search for an element of the *domain* that makes all Horn clauses true

Horn constraints for SumMax

$$s' = 0 \wedge m' = 0 \wedge i' = 0 \Rightarrow I'$$

$$I \wedge i < a.L \wedge s' = a + a[i] \wedge \\ m' = \max(m, a[i]) \wedge i' = i + 1 \Rightarrow I'$$

$$I \Rightarrow s \leq a.L * m \vee i < a.L$$

(Solution: $I \equiv i \leq a.L \wedge s \leq i * m$)

Can we solve this with...

- Enumerative search?

$$\bullet I ::= T \leq T \mid I \ \&\& \ I$$

$$\bullet T ::= x \mid T.L \mid T + T \mid T * T$$

- Sketch?

$$\exists I. \forall x. Q(I, x)$$

$$\exists c. \forall x. Q(I[c], x)$$

Lattice search

Idea: if domain is a lattice, can search more efficiently

$$\phi \Rightarrow I'$$

$$I \wedge \psi \Rightarrow I'$$

$$I \Rightarrow \omega$$

Least fixpoint (forward search)

✗

$$\phi \Rightarrow I'$$

$$I \wedge \psi \Rightarrow I'$$

$$I \Rightarrow \omega$$

Least fixpoint (forward search)

$$\phi \Rightarrow I'$$

$$I \wedge \psi \Rightarrow I'$$

$$I \Rightarrow \omega$$

Least fixpoint (forward search)

- ✓ $\phi \Rightarrow I'$
- ✓ $I \wedge \psi \Rightarrow I'$
- ✗ ✓ $I \Rightarrow \omega$

- Finds the *strongest* solution
- Did not have to look at all candidates
- Relies on efficient weakening operation

Example

Domain = all conjunctions of predicates from
 $\{p, q, r\} \equiv \{i \leq a.L, i \geq a.L, i \neq a.L\}$

$$i' = 0 \wedge a.L > 0 \Rightarrow I'$$

$$I \wedge i < a.L \wedge i' = i + 1 \Rightarrow I'$$

$$I \Rightarrow i = a.L \vee i < a.L$$

Example

Domain = all conjunctions of predicates from
 $\{p, q, r\} \equiv \{i \leq a.L, i \geq a.L, i \neq a.L\}$

$$i' = 0 \wedge a.L > 0 \Rightarrow I'$$

$$I \wedge i < a.L \wedge i' = i + 1 \Rightarrow I'$$

$$I \Rightarrow i = a.L \vee i < a.L$$

Example

Domain = all conjunctions of predicates from
 $\{p, q, r\} \equiv \{i \leq a.L, i \geq a.L, i \neq a.L\}$

$$i' = 0 \wedge a.L > 0 \Rightarrow I'$$

$$I \wedge i < a.L \wedge i' = i + 1 \Rightarrow I'$$

$$I \Rightarrow i = a.L \vee i < a.L$$

Example

Domain = all conjunctions of predicates from
 $\{p, q, r\} \equiv \{i \leq a.L, i \geq a.L, i \neq a.L\}$

- ✓ $i' = 0 \wedge a.L > 0 \Rightarrow I'$
- ✓ $I \wedge i < a.L \wedge i' = i + 1 \Rightarrow I'$
- ✓ $I \Rightarrow i = a.L \vee i < a.L$

Greatest fixpoint (backward search)

$$\begin{aligned}\phi &\Rightarrow I' \\ I \wedge \psi &\Rightarrow I' \\ \textcircled{\times} \quad I &\Rightarrow \omega\end{aligned}$$

Greatest fixpoint (backward search)

- ✓ $\phi \Rightarrow I'$
- ✓ $I \wedge \psi \Rightarrow I'$
- ✓ $I \Rightarrow \omega$

- Finds the *weakest* solution
- Relies on efficient *strengthening* operation
 - hard to implement

From verification to inference

Verification

$$\forall x . Q(x)$$

$$\equiv \exists x . \neg Q(x)$$

SMT

UNSAT / SAT

Inference

$$\exists I . \forall x . Q(I, x)$$

Fix the domain
lattice \rightarrow lattice search
otherwise \rightarrow
combinatorial search

From inference to synthesis

Verification

$$\forall x . Q(x)$$

$$\equiv \exists x . \neg Q(x)$$

SMT

UNSAT / SAT

Inference

$$\exists I . \forall x . Q(I, x)$$

Fix the domain
lattice \rightarrow lattice search
otherwise \rightarrow
combinatorial search

Synthesis

$$\exists I \textcolor{red}{P} . \forall x . Q(\textcolor{red}{I}, \textcolor{red}{P}, x)$$

Program synthesis

```

{pre}
??
while (??)
  invariant ??;
  { ?? }
  ??
{post}
  
```

$\{pre\}$
 $S_i(x, x')$
 $\{I[x \mapsto x']\}$
 $\{I \wedge G_0\}$
 $G_1 \rightarrow S_1(x, x')$
 $G_2 \rightarrow S_2(x, x')$
 $\{I[x \mapsto x']\}$

$\{I \wedge \neg c\}$
 $S_f(x, x')$
 $\{post\}$

$\exists S \ G \ I. \forall x .$

$pre \wedge S_i \Rightarrow I'$

\wedge
 $I \wedge G_0 \wedge G_1 \wedge S_1 \Rightarrow I'$

$I \wedge G_0 \wedge G_2 \wedge S_2 \Rightarrow I'$

\wedge

$I \wedge \neg G_0 \wedge S_f \Rightarrow post$

synthesis condition

$\exists I \ P. \forall x . Q(I, P, x)$

Synthesis constraints

Similar to Horn constraints but not quite

$$I \wedge G_i \wedge S_i \wedge \psi \Rightarrow I'$$

$$I \wedge G_i \wedge S_i \Rightarrow \omega$$

$$\top \Rightarrow G_i \vee G_j$$

Domain for I, G_i : like in inference

Domain for $S_i = \{x' = e_x \wedge y' = e_y \wedge \dots \mid e_x, e_y, \dots \in Expr\}$

- conjunction of equalities, one per variables

Solving synthesis constraints

$$I \wedge G_i \wedge S_i \wedge \psi \Rightarrow I'$$

$$I \wedge G_i \wedge S_i \Rightarrow \omega$$

$$\top \Rightarrow G_i \vee G_j$$

Can we solve this with...

- Enumerative search?
 - Sure (slow)
- Sketch?
 - Yep!
 - Look we made an unbounded synthesizer out of Sketch!
- Lattice search?
 - That's what VS3 does
 - Great for I, G , not so great for S (why?)

This week

We can reason about unbounded loops using *loop invariants*

- Hoare logic soundly translates a program with a loop (and invariant) into three straight-line programs

We can synthesize a program with a loop by synthesizing *those three straight-line programs* (and the invariant)!

- Can use existing synthesis techniques

Powerful idea: to synthesize a provably correct program, look for the program *and its proof* together
